

Munich Hacking Legal Challenge

Building the AI Legal Agent Platform for BMW Group

The central question

How can AI agents support the legal department of a global corporation in such a way that lawyers work hand-in-hand with AI agents in strategic, legal, value-adding work?

The Challenge

Develop an **AI agent platform for the legal department** – an intelligent, collaborative multi-agent environment that accepts, processes, delegates, reconciles legal tasks autonomously and returns the results to humans in a structured way.

Imagine a solution like *Moltbook*¹ – but specialized in the legal and international requirements of a corporate legal department.

The Vision

The goal is to build a **scalable, modular AI agent platform** that:

- receives, recognises and classifies legal tasks
- is specialized on AI agents
- coordinates tasks and delegates them between agents
- consolidates results in a quality-assured manner
- ensures transparency, traceability and governance
- and interact seamlessly with human lawyers

Possible Use Cases

Typical tasks of a corporate legal department include, but are not limited to, the following, which could be translated into agent logic, such as:

- 📄 Contract drafting, review and negotiation
- 🌐 Country and jurisdiction-specific legal searches (esp. DE, USA, UK, FR)
- ⚖️ Processing of dispute cases (in and out of court)
- 📧 Answering internal legal inquiries (e.g. from specialist agencies)
- 🔍 Compliance checks (e.g. sanctions lists, supply chain law, ESG)
- 📚 Knowledge Management & Precedent Search
- 🏠 Administrative and non-legal activities (e.g. appointment coordination, auditing)

¹ Moltbook is an AI-native work platform in which several specialized AI agents collaboratively take on, work on, and coordinate tasks with each other. Similar to a digital team of experts, agents can accept work packages, share results, coordinate intermediate steps, and return structured results to humans. The focus is on orchestration, role logic, and scalable collaboration between autonomous AI instances within a shared workspace.

Expected solution design

The Munich Hacking Legal solution should:

1. **Identify relevant AI agent frameworks**
2. **Identify business requirements – and the business case!**
 - What workflows can be handled by AI agents?
 - What does the integration of AI agents into legal processes look like?
 - Where is interaction with people (e.g. further content, releases) necessary?
 - How does this make a Legal Department more efficient?
 - How are transparency and control ensured?
3. **Define agent roles:** e.g. Contract Agent, Negotiation Agent, Compliance Agent, Research Agent (for civil law, tax, criminal law, etc.), Risk Agent, Orchestrator Agent
4. **Sketching Technical Architecture**
 - Building the AI agent platform and integrating LLMs
 - AI Agent Orchestration
 - Interfaces to systems
 - E.g., web search, legal data hub from the publishing house Dr. Otto-Schmidt
5. **Implementation:** Let's Hack Legal!
 - Based open standards and frameworks (such as MCP)
 - Front-End
 - Back-End

Deliverables

At the end of the hackathon, we look forward to:

- Creative solutions and promising solutions
- 🍀 An architectural concept (visually or technically described)
- 🛠️ A clickable prototype or functional demonstrator
- 📊 A clear representation of the added value for efficiency, quality and risk mitigation
- Open-source results and software
- A motivated team that wants to continue working on the topic
